                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1, Application US/08250030
Patent No. 5643723
GENERAL INFORMATION:
APPLICANT: Persint Detection of a Genetic Locus Encoding
TITLE OF INVENTION: Resistance to Rifampin in Mycobacterial Cultures and
TITLE OF INVENTION: Clinical Specimens
NUMBER OF SEQUENCES: 15
CORRESPONDENCE ADDRESS:
ADDRESSEE: Schwegman, Lundberg & Woessner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó

Sequence 108, Application US/08961527

Patent No. 6420135

GENERAL INFORMATION:

TITLE OF INVENTION: Streptococcus pneumoniae Polynucleotides and Sequences NUMBER OF SEQUENCES: 391

CORRESPONDENCE ADDRESS:

ADDRESSEE: Human Genome Sciences, Inc.

STREET: 9410 Key West Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GENERAL INFORMATION:

These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a CC movel PCR restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to De identified and comparing the RFLP patterns from the known rpoB gene GC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (HTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC experiment, including those difficult to distinguish by usual biochemical CC detecting specific Mycobacterial species.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC novel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFID) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to CC experiments with the unidentified fragment. The rpoB gene fragments of the vide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC election of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC fragments is rapid, precise, simple and cost effective (only 1 pCR required), and can differentiate between many species in a single tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

          The present sequence for Mycobacterium gordonae type I rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a movel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. Leprae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for

CC The present sequence for Mycobacterium gordonae type II rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC novel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene CC fragments with the unidentified fragment. The rpoB gene fragments CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for Selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HIV) Analysis of the rpoB gene CC required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical CC detecting specific Mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          В

                                                                                                        The present sequence for Mycobacterium gordonae type III rpoB gene CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from CC various Mycobacterial species. These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC novel PCR-restriction fragment length polymorphism analysis (PRA) CC method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, CC amplifying and digesting the DNA fragment from the microorganism to comparifying the RFLP patterns from the known rpoB gene CC digeners with the unidentified fragment. The rpoB gene fragments (PRA) gene CC are useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC diagnosis or to obtain epidemiological and pathogenesis information for CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected CC with human immunodeficiency virus (HTV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single comparation described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş

                                                                                                                                                  polymorphism (RFLP) pattern of the 24 rpoB gene fragments: isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae
                          and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                   The present sequence for Mycobacterium tuberculosis rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism comprises obtaining a restriction fragment length polymorphism.

AAS05206
                                                                                                                                                                                                                                                                                           The present sequence for Mycobacterium terrae rpoB gene
CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC movel PCR-restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RFLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC diagnosis or to obtain epidemiological and pathogenesis in subjects infected
CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual biochemical
CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
CC detecting specific Mycobacterial species.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                converted with the control of proposition of appropriate the patterns using a control of the method. The method comprises obtaining a restriction fragment length composition fragment length composition of the 24 rpoB gene fragment; isolating, compilitying and digesting the DNA fragment from the microorganism to be identified and comparing the RPIP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments comparing the range of Mycobacterium species, e.g. for control of appropriate therapies, including M. tuberculosis, e.g. for control of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene control of ragments is rapid, precise, simple and cost effective (only 1 PCR crequired), and can differentiate between many species in a single control of the poB gene control of th

                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                         polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence for Mycobacterium ulcerans rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism comprises obtaining a restriction fragment length polymorphism.

cc novel pcr-restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RFLP patterns from the microorganism to
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC and non-tuberculous mycobacteria (NYM) encountered in subjects infected
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC fragments is rapid, precise, simple and cost effective (only 1 pcR
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual biochemical
CC detecting specific Mycobacterial species.

Ax

Common the composition of the probes (AASO5227-AASO5242) for
CX
CA detecting specific Mycobacterial species.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The present sequence for Mycobacterium avium rpoB gene
CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC novel PCR restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RFLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC are useful to identify a wide range of Mycobacterium species, e.g. for
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC required, and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual biochemical
CC tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
CC detecting specific Mycobacterial species.

CC The present sequence for Mycobacterium bovis rpoB gene
CC fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
CC various Mycobacterial species. These rpoB gene fragments can be used
CC in the diagnosis and identification of Mycobacterium species using a
CC novel PCR-restriction fragment length polymorphism analysis (PRA)
CC method. The method comprises obtaining a restriction fragment length
CC polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
CC amplifying and digesting the DNA fragment from the microorganism to
CC be identified and comparing the RPLP patterns from the known rpoB gene
CC fragments with the unidentified fragment. The rpoB gene fragments
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC diagnosis or to obtain epidemiological and pathogenesis information for
CC selection of appropriate therapies, including M. tuberculosis, M. leprae
CC with human immunodeficiency virus (HIV). Analysis of the rpoB gene
CC required), and can differentiate between many species in a single
CC experiment, including those difficult to distinguish by usual blochemical
CC detecting specific Mycobacterial species
CC detecting specific Mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism \, -

These rpoB gene fragments can be used CC in the diagnosis and identification of Mycobacterium species using a CC novel pCR-restriction fragment length polymorphism analysis (pRA) CC polymorphism (RFLP) pattern of the 24 rpoB gene fragment; isolating, CC amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene CC fragments with the unidentified fragment. The rpoB gene fragments care useful to identify a wide range of Mycobacterium species, e.g. for CC diagnosis or to obtain epidemiological and pathogenesis information for CC selection of appropriate therapies, including M. tuberculosis, M. leprae CC and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene CC required), and can differentiate between many species in a single CC experiment, including those difficult to distinguish by usual blochemical CC tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for CC detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The present sequence for Mycobacterium fortuitum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,

                                                                                                                                                                                   amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraples, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                        Sequence

                                                                                                                                     MTU318821

Wycobacterium tuberculosis partial rpoB gene for RNA polymerase beta subunit, isolate 1071-98.

AJ318821

AJ318821. G1:22208418

RNA polymerase beta subunit; rpoB gene.

Wycobacterium tuberculosis.

Bacteria; Actinobacteria; Actinobacteriase, Actinomycetales; Corynebacterium away wycobacterium; Mycobacteriase, Mycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriase, Hycobacteriasese, Hycobacteriasese, Hycobacteriasese, Hycobacteriasese, Hycobacteriasese, Hycobacteriasese, Hycobacteriasese, Hycobacteriasese, Hycobacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 (bases 1 to 970)

Mycobacterium tuberculosis
Bacteria: Firmicutes; Actinobacteria: Actinobacteridae;
Actinomycetales; Corynebacterineae; Mycobacteriaceae;
Mycobacterium; Mycobacterium tuberculosis complex.
I (bases 1 to 3853)
Imboden, P., Troller, R., Marchesi, F., Telenti, A., Bodmer, T.,
Cole, S., Schopfer, K. and Burkart, T.
The robB gene of Mycobacterium tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Mycobacterium tuberculosis (strain Rv) DNA.
Mycobacterium tuberculosis
Bacteria: Actinobacteria: Actinobacteriae;
Corynebacterineae; Mycobacteriaceae; Mycobacterium; Mycobacterium
Luberculosis complex.

in 335 aa overlap). Also similar to many otherM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon; if this cannot be identified we choose the most upstream initiation codon.
                                                                                                                                                                                                                  Submitted (11-JUN-1998) Submitted on behalf of the Mycobacterium tuberculosis sequencing and mapping teams, Sanger Centre, Wellcome Trust Genome Campus, Hinkton, Cambridge CB10 15A Unite de Genetique Moleculaire Bacteriene, Institut Pasteur, 28 rue du Docteur Roux, 75724 Paris Cedex 15, France E-mail: parkhill@sanger.ac.uk

DNASE I was heat-inactivated at 750c for 5 min and removed by using RNeasy columns followed by phenol extraction and ethanol precipitation. The RNA preparations were confirmed to be free of genomic DNA contamination by carrying out PCR and RT-PCR using the Access kit (Promega) and primers specific for the histone-like protein gene hip (Lee et al., 1989). CDNA was synthesized using random hexamer primers (Promega) and Stratagene's CDNA synthesis kit. CDNA fragments were ligated into lambda ZAP II vector and packaged in vitro using Stratagene reagents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               //note="vector: DebiabACI1; Site_1: HindIII; Site_2: HindIII; Rice is one of two most popular grains in the world. Half of the world population especially those inhabiting highly populated areas of the hund tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Niponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /clone_lib="CUGI Rice BAC Library"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anol: Stress condition II library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (NH4+ - containing) and shifted to TAP - NO3- (24hrs); H2 production conditions (0, 12hr, 24hr) see Melis et al.,(2000) Plant Phys. 122: 127-135; TAP + H202 (1, 12, 24 hr); TAP + sorbitol (1, 2, 6, 24 hr); TAP + Cd (1, 2, 6, 24 hr). PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZaP II (Stratagene) in the EcoRI (5') and XhoRI (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al., (1996) Genome Research 6: 791-806."
